

Assignment:

Please submit your design notes & code modules at <https://github.com>. Interview discussion will be around the decisions you made and why.

Your assignment is to design & build an automation test suite to make sure the att.com home page is loading without any issues and the page is loaded as per the page configuration in CMS. The page configuration in CMS can be accessed using the API - <https://www.att.com/msapi/idp-content-orchestration/v1/idpcms/sales/uf/homepage>.

You need to use Katalon to build the automation test suite.

Please make sure we are able to download the code from github and run tests in Katalon.

PLEASE NOTE: The assignment is purposefully kept open to understand the thinking process of the interviewee. You needn't automate for all the page components but at least couple of components and order of the components.
